Participants Needed for Research Study

“Using Multimodal Measures for Emotion Recognition in Conversational Settings”

Description of Project:
In this study, we collect your behavioral and physiological responses during your conversation with a pre-intern psychologist in face-to-face and remote settings. The subject of conversations is a set of images and your related experiences and memories. Your data will be used in creating models for emotion recognition. Your participation will take around two hours. We will collect facial video, audio, brain activity with an EEG headset, heart rate, and skin conductance. You must speak English fluently and not have any neuropsychological disorders (e.g., prosopagnosia).

To learn more and participate: Please contact the researcher of the study or scan the QR code.
