GESTATIONAL ANTIDEPRESSANT DISPENSING TRENDS IN NEW ZEALAND

STEPHANIE D’SOUZA

Email: s.dsouza@auckland.ac.nz
Access to the data presented was managed by Statistics New Zealand under strict micro-data access protocols and in accordance with the security and confidentiality provisions of the Statistics Act 1975. Our findings are not Official Statistics. The opinions, findings, recommendations, and conclusions expressed are those of the researchers, not Statistics NZ.
DEPRESSION

- Disorder characterised by depressed mood, loss of interest and enjoyment, and decreased energy

- WHO-estimated prevalence:
  - 4.4% globally
  - 5.1% females vs. 3.6% males

- Exacerbated during major life events (e.g. pregnancy)
  - Pregnancy prevalence: 7-13%
  - 11.9% in longitudinal *Growing Up in New Zealand* study

## DEPRESSION IN PREGNANCY

- Antidepressants can contribute to treatment

- Concerns about risks to child associated with both gestational depression and antidepressant intake
  - Mixed findings
  - Antidepressants vs gestational depression
  - Gestational depression vs postnatal/later depression

---

For some women, antidepressants may be particularly helpful

Talk therapy is undoubtedly beneficial, but may be harder to access than medication

Important to understand:

1. Existing trends (over time and across sociodemographic groups) in antidepressant intake during pregnancy
2. Unmedicated depression – how prevalent? Does this vary across sociodemographic groups?
3. Are the risks associated with gestational antidepressant intake greater than risks associated with unmedicated depression?
ANTIDEPRESSANTS IN PREGNANCY

- Important to understand:
  1. Existing trends (over time and across sociodemographic groups) in antidepressant intake during pregnancy
  2. Unmedicated depression – how prevalent? Does this vary across sociodemographic groups?
  3. Are the risks associated with gestational antidepressant intake greater than risks associated with unmedicated depression?

- Are we seeing changes over time? Is it getting more prevalent?
- Are we seeing differences across sociodemographic groups?
  - Might demonstrate issues with access
Important to understand:

1. Existing trends (over time and across sociodemographic groups) in antidepressant intake during pregnancy
2. Unmedicated depression – how prevalent? Does this vary across sociodemographic groups?
3. Are the risks associated with gestational antidepressant intake greater than risks associated with unmedicated depression?

- Are many women who are experiencing depression not receiving medication?
- Differences by sociodemographic groups may further indicate a vulnerable group with access difficulties
ANTIDEPRESSANTS IN PREGNANCY

Important to understand:

1. Existing trends (over time and across sociodemographic groups) in antidepressant intake during pregnancy
2. Unmedicated depression – how prevalent? Does this vary across sociodemographic groups?
3. Are the risks associated with gestational antidepressant intake greater than risks associated with unmedicated depression?

Are there risks associated with antidepressant intake/unmedicated depression relative to those not taking medication or experiencing depression? Does the risk differ between those on antidepressants compared to those with unmedicated depression?

- Birth outcomes and longer term cognitive, behavioural and mental health outcomes
ANTIDEPRESSANTS IN PREGNANCY

- Important to understand:
  1. Existing trends (over time and across sociodemographic groups) in antidepressant intake during pregnancy
  2. Unmedicated depression – how prevalent? Does this vary across sociodemographic groups?
  3. Are the risks associated with gestational antidepressant intake greater than risks associated with unmedicated depression?
**Data Source:** Statistics New Zealand Integrated Data Infrastructure (IDI)

- Large database of de-identified administrative and survey data.
- Linked at the individual level
- Can connect information about a person across different sources
All resident New Zealand women who gave birth, taken for each fiscal year between 1st July 2007 and 30th June 2018.

- Identified via Department of Internal Affairs birth records
- Estimated approximate date of conception based on gestational age at birth

ANTIDEPRESSANTS

Obtained from the Ministry of Health community pharmaceutical dispensing collection

- Selective serotonin re-uptake inhibitors (SSRIs)
- Monoamine oxidase inhibitors (MAOIs)
- Serotonin & noradrenaline re-uptake inhibitors (SNRIs)
- Tricyclic antidepressants (TCAs)
- Tetracyclic antidepressants (TeCA)
- Noradrenergic & specific serotonergic antidepressants (NaSSAs)
**Data analysis:** Dispensing for each fiscal year

\[
\frac{\text{Number with one or more dispensing}}{\text{Total number in resident pregnant population}} \times 1000
\]

**Prevalence also calculated for:**

Each trimester, 3m and 6m pre-pregnancy, age groups, ethnicity (total response), 2013 NZDep quintiles and medication type.

• Netherlands: 2.0%, 1.8% and 1.8%  
• US: 5.1%, 3.8% and 4.1% |
SOCIODEMOGRAPHIC DIFFERENCES

- Younger women and those from most deprived areas have the lowest dispensing prevalence
  - Younger age and low SES are risk factors for antenatal depression
  - Lower dispensing prevalence reflecting barriers to accessing medication?

- Highest dispensing prevalence in NZ Europeans
  - NZ Europeans are less likely to experience serious depressive symptoms or mood disorders during pregnancy relative to all other ethnic groups
  - Could reflect differences in access to healthcare or cultural differences in treatment and perception of depression

- Bowden et al. (2019) observed similar ethnicity and deprivation differences in antidepressant dispensing in NZ youth
NEXT STEPS

1. Existing trends (over time and across sociodemographic groups) in antidepressant intake during pregnancy
2. Unmedicated depression – how prevalent? Does this vary across sociodemographic groups?
3. Are the risks associated with gestational antidepressant intake greater than risks associated with unmedicated depression?

- The IDI is based on service use
  - Not great for evaluating soft measures (e.g. symptoms) and biased in favour of those who use services
  - No GP information

- Needs to be supplemented with data sources that provide this information
  - Representative surveys/longitudinal studies
NEXT STEPS: GROWING UP IN NEW ZEALAND STUDY

1. Look at sociodemographic differences in antidepressant intake during pregnancy
   - Do they align with what we’re seeing in the population

2. What proportion are experiencing unmedicated depression?
   - Edinburgh Postnatal Depression Scale – screen for antenatal and postnatal depression
   - Previous research with this study has identified that younger mothers, non-European mothers and those from low income homes are more likely to be experiencing depression in pregnancy

3. Are there differences in the risk of adverse child outcomes between women with unmedicated depression compared to women on antidepressants?
   - Birth outcomes, cognition, behaviour, mental health

CHILD OUTCOMES

**Antenatal**
- Birthweight
- Pre-term birth

**2 years**
- Behaviour (SDQ)

**54 months**
- Behaviour (SDQ)
- Receptive language (Adapted PPVT-III)
- Early literacy (DIBELS letter naming fluency)
- Executive control (Luria hand clap task)

**8 years**
- Behaviour (SDQ)
- Emotion, cognition, and motor abilities (NIH toolbox)
- Anxiety (PROMIS)
- Depression (CES-DC)
ADDITIONAL POINTS

- Not everyone may WANT to be on medication
  - Individual preferences
  - Ethnic and cultural backgrounds may influence treatment choice

- This is not to diminish the massive importance of talk therapy
  - This can be expensive and difficult to access as a long-term option for some women

- This research can hopefully inform treatment options for women who find antidepressants helpful but are worried about risks to their child
